

Total Synthesis of (

Retrosynthesis

To maximize convergency, **1** is split down the middle at the pyridone ring, yielding fragment **5**

derived from 4-chlorobenzonitrile and 4-aminobenzonitrile, and fragment **6** which can be accessed through hydrogenation and desymmetrization of a mesitylene-derived tyleno

Stereoselective Hydrogenation

Amidation – Preparation of directing group

Pd-catalyzed asymmetric oxidation

Of note: The role of Ac₂O is unknown, but was found to improve reaction yield. The reaction is particularly sensitive to moisture, so it may act as a desiccant.

Directing group screening

Wittig Olefination

Oxidation

Esterification and 1,2-diol protection

Multi-step formation of epoxide

(-)-Maximiscin (1)

Di-acid activation, "Aza-Sakurai" cyclization, and final deprotection
